## AMC Continues To Develop State-of-the-Art ScanNet Interface Solutions

---

### Alarm Monitoring

The Alarm Monitor is designed to send email notifications to specified users when events are triggered on the ScanNet server. The operator may specify any type of message event to be alerted on. These include general 1024 messages which can also be filtered to a specific error message string.

### eNet Validation

eNet Validation creates efficient internet parking validation. It allows merchants to effectively manage employees, accurately track usage, and generate validation reports. It enables operators to set-up merchants, assign roles, and run full reports for a selected time period. The system has recently been updated to track prepaid merchant billing. It can either be a web based solution or a stand-alone Windows application. See a demo at [www.enetvalidation.com](http://www.enetvalidation.com).

### PARCS Dashboard

A simplified real-time screen containing all essential information. It provides streamlined revenue and access control information on one screen, eliminating the need for multiple ScanNet reports. It displays real-time transactions from any revenue collection device, messages from all card readers in a garage, along with all daily interactions.

### Counts and Revenues System

Consolidates revenue and access data into a comprehensive report. The revenue and ticket counts can be displayed in detail, by selected date range, predetermined specific group or in a general summary. It allows the user to set start-of-day. The application can be run against the current database or the bak scan.

### ValuePass Recharge

This application acts like a prepay feature in ScanNet. The monthly access card is charged as it is used by patron. Periodically, as determined by user, a process is run to charge the patron's accumulated parking charges to a credit card using a central credit card system. The application is PCI compliant.

## Event Tracking

Conveniently see the amount of revenue your event collected. It allows the user to track the event by revenue and attendant and is integrated with ScanNet Facility Management software. The user can set the event fee to vary from normal rates, determine amount of time a ticket is valid, and allow for attendees to prepay for the event.

### How It Works

1. Purchase Ticket for Specific Event
2. On the Day of Event, Enter Garage
3. Receive Special Rate Ticket From Ticket Dispenser

### Easily Accessible Reports

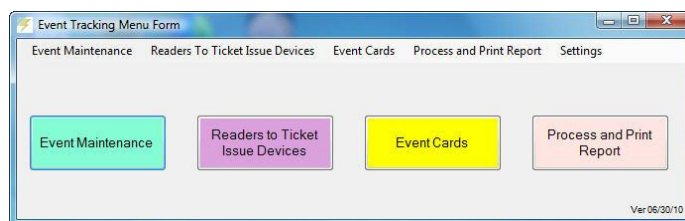

Number of Tickets Issued

Who Issued the Ticket

Revenue Collected

### Allows Operator To

- Before the event
  - Set-up Event (date range, dollar amount)
  - Set-up cards
  - Associate cards
- After Event
  - Run a report for each event that includes counts and revenues by attendant and summary totals.

## ScanNet Interfaces

We have created several interfaces to the ScanNet database utilizing Web Services, HTTP SOAP, FTP, Serial, TCP/IP Sockets, fixed files, comma separated values (CSV files) and Microsoft SQL tables. We can directly update readers using dll calls for standard credentials or generate a PGM file. The update generates PFM files that update card status of the readers at one time. We have interfaces that turn on and off cards, update the usual credential, patron, customer, and vehicle tables. Also, we have interfaces that update credit card tables, merchant tables, group tables, financial tables, and ticket tables.

## **New AMC Website Unveiled May 1<sup>st</sup>**

[www.amc-hln.com](http://www.amc-hln.com)

We will have our new website operational May 1<sup>st</sup>, 2011. Please click the feedback button and let us know what you think. Also, feel free to create an account (login name & password) for future downloads from the site. Links for future software downloads will be provided only with a valid account.

Contact Ray (406-442-6665 or [ray@amc-hln.com](mailto:ray@amc-hln.com)) if you have questions about the ScanNet toolkit; including modifying credentials, setting validity status, purging tickets, log cleaners, copying credentials, card turn off, changing customer id's, ticket tracking, credential tracking, group reset and more.
