ScanNet® Tools for Technicians

No ScanNet® Service Technician should be without these tools in their bag of tricks.

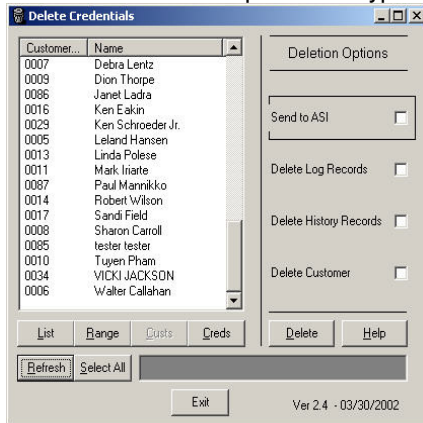

Also a bonus for your power ScanNet® Customers and users.

Just \$600 usd per package
A smart investment for your Technicians

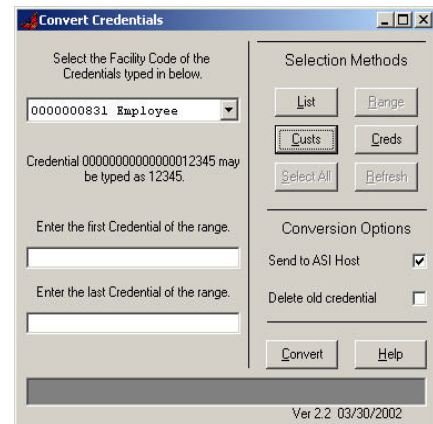

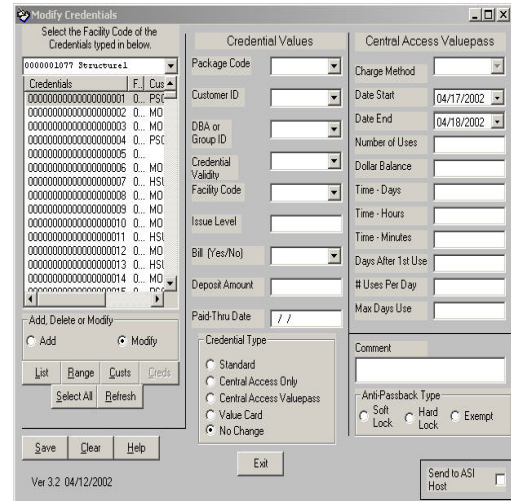

Add/Modify Credentials - Probably the most useful tool contained in the toolbox. Allows the user to Add or Modify credentials. Versatile enough that you may not have to use the Access Control system distributed with ScanNet®. You can even work with ValuePass Credentials. Credentials can be accessed four different ways: List individual credential numbers, specify a range of credential numbers, select a customer to work with their associated credentials, or tag individual credentials from a list.

You can even set the passback type and the expiration date for use with the CAMP access program.

Delete Credentials - One of the features missing with ScanNet® is the ability to delete a credential from the system and, optionally, to have all the associated, customer, history and financial records deleted as well. This tool solves that problem. As with the Modify Credential tool above, credentials can be accessed four different ways.

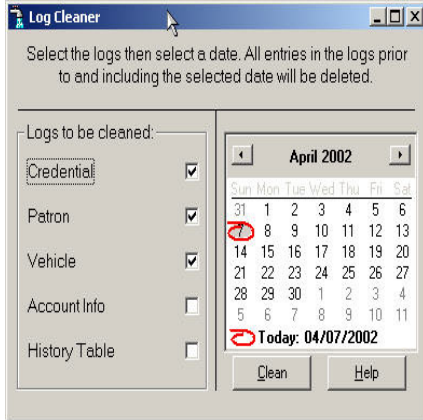

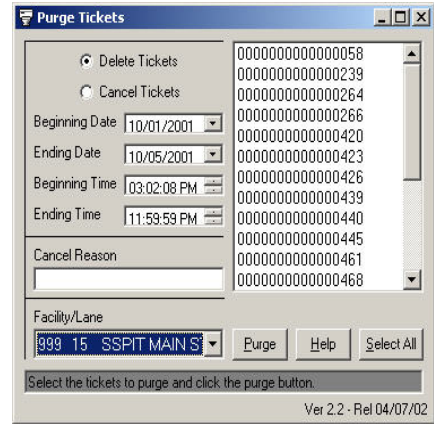

Convert Credentials - Developed for those applications where an existing ScanNet® installation finds it necessary to convert from a standard card system to a Central Access system. Tool will calculate the new credential number, and update all of the history records associated with the old credential number. Optionally, you can keep the old credential record in the credential table. As with the above two tools, credentials can be accessed four different ways.

Purge Tickets - An alternate to the purge tickets feature of ScanNet®. Much more convenient than the standard ScanNet® program and keeps you in good graces with the financial auditor. A ticket represents revenue,. By simply purging the tickets, you lose track of those original ticket records. The major feature of this tool is the ability to 'Cancel' tickets. When 'Canceled', the tickets are removed from the issued ticket table and placed in a ticket audit table. You can also attach a comment explaining the reason for canceling the tickets. Auditors love this feature! Additionally, you can easily isolate the specific tickets you want to work with by date/time, Lane or even selecting individual tickets from the list.

Log Cleaner - Another one of those tools needed to clean out audit trail records that are no longer useful. Whenever a credential, patron, vehicle or customer records is added, modified or deleted, a record is written to a log file. Normally used for tracking changes made by operators, the records become less than useful after a period of time. This tool allows you to clean out the older records at your convenience. You can also remove access history records that were created by the CAMP module.

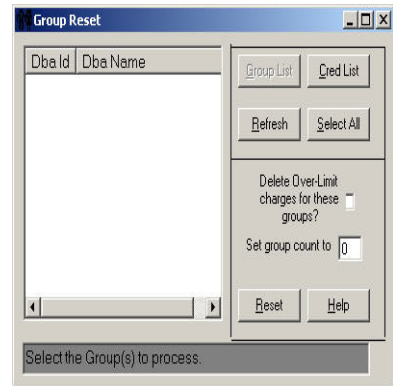

and invoicing or Group Overuse feature of ScanNet®, this tool is a must. Each of the features can generate financial records to the ScanNet® Financial table.

Financial Cleaner - If you are using the ValuePass, billing and invoicing or Group Overuse feature of ScanNet®, this tool allows you to remove the older records from the table as their useful life has expired. You can select a cut-off date for the records you want to remove.

Validity Cycle - For those users that miss the ability to 'cycle' the credential validity code feature that was available in ScanNet® for DOS. The feature is not completely implemented in ScanNet®. Now it is back and more versatile than ever! You can select credential types and print reports that represent the credentials affected. Additionally, you have the ability to program the Standard readers as you see fit for the selected validity type change.

Group Reset - A tool that is an alternate to the feature built into ScanNet®. If the DBA/Group feature of ScanNet® is being used, this allows the resetting of the group count and the cleaning out of any errant group overuse records that may be laying around.

Account Type Maintenance - A simple method for assigning Account type codes to multiple customers. Account type can be used to further refine a report by isolating records by account type.
